ADP: Ambition Delivery, Please?

The week began on a high note with positive signals coming from some major emitters, they’re moving in the right direction, but all countries can go further and faster. ECO expects - and the world needs - more positive signals alongside concrete additional commitments between now and the Ban Ki-Moon Summit in September, COP20 in Lima, all the way to the March 2015 deadline.

You might be asking, what about today? ECO has been perusing the information note for this Ministerial and noticed its four objectives for the session, so here’s our take on what your role is on:

1. Motivating the Parties to do more
ECO promises to have our cheerleaders - in custom outfits in your national colours, chanting in your native language - out for any Minister announcing new mitigation, financial commitments or actions pre-2020, in any session. This offer remains open through to the Ban Ki Moon Summit!

2. The political implications of the IPCC findings, for both mitigation and adaptation
The results of the AR5 are crystal clear. All fossil fuel emissions need to be phased out and we need to start immediately if we want to remain within the lowest temperature limit of 1.5°C. It’s not just about phasing out all the bad stuff, we need to phase in the good stuff too - a 100% renewable future with sustainable energy access for all.

WGII reflects that our adaptation response to current extreme weather events remains low, highlighting an “adaptation deficit” in both developing and developed countries. ECO is concerned that this is being replicated in the ADP. Let’s be clear: a 2015 agreement is not politically or practically feasible without addressing the deficit. The ADP must have significant support to scale up adaptation action for developing countries if it wants to protect the most vulnerable people and ecosystems.

Adaptation has long been given a lower priority in the negotiations, including in the ADP. ECO is pleased to see many developing countries now seriously considering what a new agreement needs to deliver to match their growing adaptation needs, and address loss and damage. A key element is more resources provided by rich countries. We also need to start thinking on how we can all be preparing for the impacts of climate change. Ask yourselves, Ministers, what would climate change look like if we took it as seriously as we did the global financial crisis? This is a global challenge and we need radical changes to protect our planet from a climate disaster. Take off your party political hats, and put on your thinking caps! We need bolder and braver policies to protect us from climate change.

3. Preparation of nationally determined contributions from all Parties
ECO has many wise friends in many countries. These friends would like to help support the ADP by conducting an independent civil society review of initial pledges on both adequacy and equity. This review will cover not only mitigation offers, but also what rich countries are planning to provide on climate finance (for both mitigation and adaptation), as a crucial element of those countries’ fair share in the global effort. Ministers, our friends don’t bite...unless you’re timid with your ambition! The ADP needs to create a formal space for civil society reviews, and the independent analyses and reviews we expect other expert groups (like UNEP) to produce, as to inform the process. This is extremely important and must not be allowed to fall through the cracks. Concrete signals on this assessment process today and an agreement on it in Lima are critical.

4. Providing political guidance and support for the ADP
Ministers, though sometimes you may suspect otherwise, ECO does like you! We get very upset when you don’t show up to things (see yesterday’s edition). It’s up to you to lead the convoy as we head to Paris. Climate change is the most pressing challenge of the 21st century and this calls for continued political engagement at the highest levels until the crisis is solved.

Ministers, roll up your sleeves and get stuck in – the world needs your leadership!

On June 16, CAN is turning 25 - come along to hear about CAN’s new direction and help us celebrate with a party!

Over achievement or under ambition?

The EU has made no efforts to hide their personal satisfaction at projecting it will overachieve its 20% target for 2020. According to the EU’s KP “ambition” submission, they’re on a pathway to a reduction of 22.8% on average during the second commitment period. Not forgetting that the latest numbers released just a couple of days ago confirmed that the EU has already reached a level of 19.2% below 1990 levels in 2012. This looks great at first glance, but there’s more to it. In reality the EU isn’t offering any hard commitments to achieve additional reductions. A 30% reduction target has been, until recently, a lively political discussion in Europe even though NGOs are calling for a 40% reduction. The overachievement is not so much ‘over’ achievement as it is ‘under’ ambition.

EU cuts could be greater than projected without much more effort. There are additional national measures, as well as the Energy Efficiency Directive which isn’t yet accounted for, which together could shave off another 3% or more by 2020. In talking about additional cuts, the EU’s KP submission also tactfully notes the 1.6Gt of eligible ETS offsets without suggesting what to do about them. There are almost three-quarters of a GT in non-ETS offsets also allowed under EU rules. The answer is obvious: cancel the excess. Otherwise in reality EU emissions can either grow to 2020, or the 2030 target will be poisoned by banked emissions.

ECO was restless yesterday as Ministers failed to make any exciting new announcements, but this morning we woke to an inspiring rallying cry that echoed in all of the world’s languages. We’re inspired - surely leaders cannot ignore their people any longer? “Volveremos! Stand with us or step aside!”

We are people who participated in the walk out of the Warsaw Climate Conference and those who supported and united with its call for more serious climate action…We have come together to reiterate to all ‘leaders’ participating in the UN climate negotiations that they are dangerously off track in addressing the climate emergency…

We are more determined than ever to fight for the survival of our families, our communities and our peoples across the world - a survival that rests on nothing less than the fundamental transformation of a system that has generated massive impoverishment, injustices and a climate crisis that threatens all life on earth….

People are mobilising everywhere and taking to the streets in bigger numbers and increasing intensity to stand up to vested interests and fight for their future and those of the next generations…

We are back, far more strengthened in giving voice to those who are already acting with the urgency needed to avoid the worst impacts of climate change…

The global climate movement is building its strength and power in every country of the world. We call on those who claim to represent us to either act in our interests or step aside.”

Support farmers to adapt to climate change

Even though the objective of Article 2 is to stabilise global emissions before food production is threatened, impacts are already being felt around the world. Floods have damaged wheat fields in Pakistan and rice fields in Thailand. Heat waves have seriously impacted the yields of Russian wheat and US maize.

Global food security is at threat. Small-scale farmers produce the majority of the world’s food, yet they are the most food insecure, and most vulnerable to the impacts of climate change.

Mitigation is of course essential to keep temperature below 1.5°C - but the adaptation needs of developing countries, particularly their agricultural sectors, must have a high priority too.

Developed country Parties have suggested a focus on productivity levels. But as temperatures rise and precipitation becomes increasingly unpredictable, large areas in temperate and tropical countries may become progressively unsuitable for agriculture. ECO thinks that the SBSTA’s first step is build on detailed studies, like the report recently endorsed by the World Committee on Food Security, through mandating an assessment of climate change impacts on food production.

ECO asks Parties to provide support to the conservation of plant genetic diversity, and increase the resilience of smallholder agriculture systems. This will help small scale farmers to build their adaptive capacity, and help them integrate their farming systems in the local ecosystems.

Policies should be designed and implemented to enable small-scale food providers and other vulnerable populations to become more resilient to climate change through an integrated focus.

US power plant rules: a second look

After celebrating the good news out of the US on new EPA regulations to cut carbon pollution from power plants, ECO has taken the time to take a second look at the proposed plan.

The good news is that the plan looks like the real deal - it will lower emissions and put the US on the right path. The puzzler is why the administration is leaving the low-hanging fruit on the tree. Analyses suggest there are far more gains to be achieved - in both emissions reductions and cost savings - by fully harnessing energy efficiency measures and renewable energy resources. The U.S. power sector is already well on its way to meeting the EPA’s draft 2030 target. ECO thinks the US should aim much higher, introducing other regulations to further reduce emissions.
